1/2

Slope fields $y' = g(x)$

If you have a solution curve

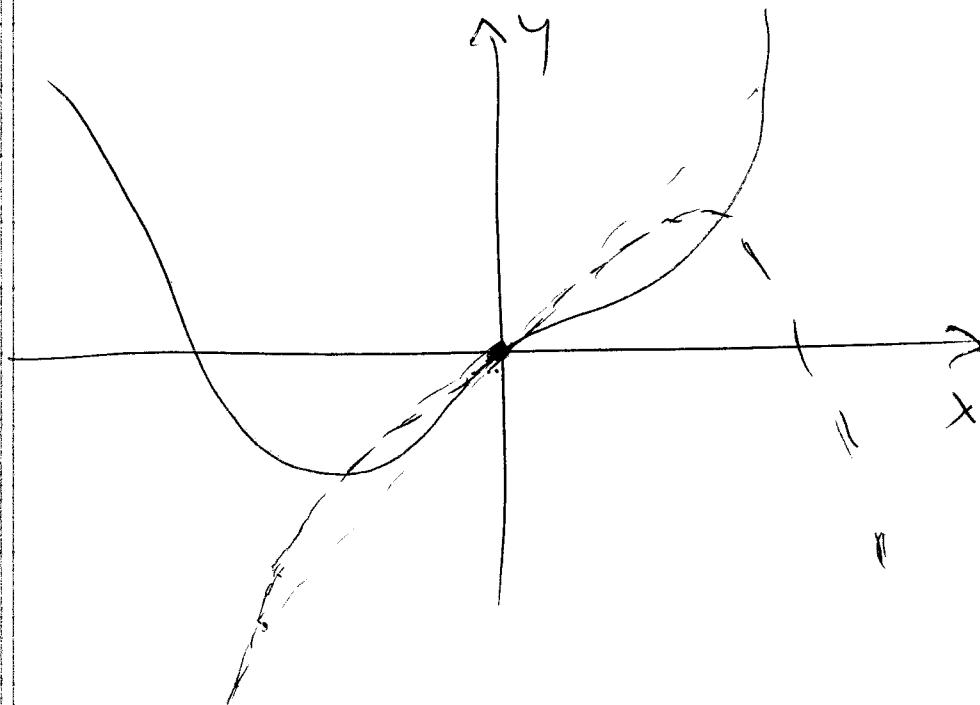

Assume g is even

- We know that the family of solution curves of $y' = g(x)$ is symmetric w.r.t. origin.
- We know there is a solution that goes through the origin (from existence)
- We know this solution is unique (from uniqueness).

Look at the solution that goes $^{2/2}$
through the origin.

Assume it is not odd

This is impossible because of
Uniqueness, since we would have 2
solutions going through the origin.
