Directions: This work is an optional assignment for those who took the first test on Monday, October 12th. It is due on Friday, October 23 before the beginning of class. **No late work will be accepted; one minute late to class is late.** If you turn this in, I will grade it (with a score out of 100) and your new grade on test 2 will be the average of the two scores you have received. If you do not turn this in, your grade on test 2 will stay the same.

Show all work on calculating the integrals below, unless you are told you can use the integration table. When you use the integration table, indicate which number you are using.

(1) Determine if the following integral converges or diverges. If it converges, find its value.

\[
\int_{-\infty}^{-4} e^{2x+3} \, dx
\]
(2) Consider the following integral.

\[ \int_0^1 \frac{3x + 5}{\sqrt{x} + x^3} \, dx. \]

a) Predict whether or not this integral converges or diverges.

b) Use comparison to prove that your prediction is correct. State the function you use in comparison, state whether it is larger or smaller than the integrand above, and give a reason why it converges or diverges.
(3) Consider a solid whose base is the region bounded by the curves
\( y = -x^2 + 3 \) and \( y = 2x - 5 \), with cross-sections perpendicular to
the \( y \)-axis that are squares.

a) Sketch the base of this solid.

b) Find a Riemann sum which approximates the volume of this solid.

c) Write a definite integral that calculates this volume precisely.
You do not have to calculate the integral.
(4) Sketch the circle of radius 1 centered at the origin and the circle of radius 1 centered at the point (1,0) both on the same axis.

a) Write an integral which represents the area of the intersection of these circles (with $x$-axis integration). You need not evaluate the integral.

b) Write an integral which represents the area of the intersection of these circles (with $y$-axis integration). You need not evaluate the integral.

c) Write an integral which represents the volume of the solid obtained by revolving this region of intersection about the $y$-axis. You need not evaluate the integral.

d) Consider the region in the first quadrant inside the circle centered at the origin and outside the circle centered at (1,0). Write an integral which represents the volume of the solid obtained by revolving this region about the $x$-axis. You need not evaluate the integral.
(5) a) Write an integral for the arc length of the curve \( y = \frac{2}{5}\sqrt{25 - x^2} \) from \( x = 0 \) to \( x = 5 \). You need not evaluate the integral. Approximate your answer with LEFT(2) and RIGHT(2).

b) Write an integral for the arc length of the parametrized curve: 
\( x = \cos(e^t) \) and \( y = \sin(e^t) \) for \( 0 \leq t \leq 1 \). You need not evaluate the integral. Approximate your answer with LEFT(2) and RIGHT(2).
